Description
Due to my change d33720e6 setting BUILD_OWN_FFTW generates a warning about no SSE being enabled in FFTW. This is because I replaced the positive test on AVX by a negative test on SSE and AVX_128. Apparently BUILD_OWN_FFTW sets HAVE_SIMD somewhere. I don't fully understand how this works, so it might be better if someone else fixes this.

Associated revisions

Revision 50b9000d - 05/15/2015 12:01 AM - Mark Abraham
Fix own-FFTW build
Recent changes broke the expectation that the own-FFTW build attempts to pretend to have run SIMD-support tests on the build that it has not yet performed. This is all more complicated than it needs to be, and will be refactored in master branch.

Fixes #1735

Revision 6ce08bf1 - 05/19/2015 11:38 AM - Mark Abraham
Refactor FFTW setup

It proved bug-prone to have both own-FFTW and find-FFTW mechanisms try to fulfill the same contract, and it was not needed in the first place. We do not need to fake the results of SIMD tests just to avoid our own warnings (and that was all that they were used for; mdrun does further SIMD-support detection at run time after possible dynamic linking of FFTW.

Now we check when there is something to check, and not when there is not. Removed TODOs and comments no longer appropriate for the refactored code.
