Spurious parameters for Argon in OPLS-AA and Charmm27

06/15/2012 01:18 AM - Lutz Maibaum

Description

The parameter file ffnonbonded.itp for the OPLS-AA force field defines two different non-bonded interactions for Argon atoms:

opls_097   Ar  18   39.94800     0.000       A    3.40100e-01  9.78638e-01 ; SIG

and

Ar         Ar     18    39.94800     0.000       A    3.41000e-01  2.74580e-02

The first one seems reasonable, but the second one has a Lennard-Jones epsilon that seems way too small (by a factor of about 35). The Charmm27 force field contains only the spurious second definition for the argon parameters.

It's not clear to me where this value for epsilon comes from, but it doesn't look right to me. Reasonable values for the energy parameter can be found here:

http://www.sklogwiki.org/SklogWiki/index.php/Argon#Lennard-Jones_parameters

It would be great if someone could look into this, and either correct the parameter or remove the argon definition from these force fields. For reference, it looks like this problem has been spotted before:

Associated revisions

Revision 6d577e17 - 11/16/2012 11:59 PM - Roland Schulz

Removing Zn and Ar non-OPLS atom types

Some parameters were clearly wrong and the source of them was not documented. They can be added back in but then the source needs to be documented.

Add source for Fe2+.

Revision 05d7d989 - 05/07/2015 04:17 PM - Berk Hess

Removed non-ff atomtypes from oplsaa and charmm27

Removed atom types Cu2+, Fe2+ and SI from oplsaa and charmm27, since they are not part of the official force fields.

Fixes #957
