GROMACS - Bug #2104

gmx order -sl indexing out of bounds

01/27/2017 12:11 AM - Edgar Galicia

Status: Closed
Priority: Normal
Assignee: analysis tools
Category: analysis tools
Target version: 5.1.5
Affected version - extra info: Difficulty: uncategorized
Affected version: 5.1.4

Description
I am having problems when running "gmx_order" utility. When I give the command -sl to divide the box into slices the utility works properly only for certain values and for others not.

If option -sl 200 is selected the error presents but if a greater number as 250 is put in, the utility runs without any problem.

Hope to find a solution in the meanwhile by myself.

Fixes SEGV in gmx order.
gmx order used a cumbersome floating point method to compute an index in a histogram leading to index -1. The present code is simpler and robust, in fact the old code was likely wrong.
Fixes #2104

I can reproduce this with release-5-1 HEAD with gmx order -s nvt3mix.tpr -n order.ndx -sl 200 -f nvt3mix.trr. The indexing of slCount[slice] at line 650 goes out of bounds, specifically slice is -1 for the frame with time 19062.

My first thought was that's because the trajectory doesn't conform to whatever (undocumented) PBC preconditions this tool has, but actually line 649 looks problematic. slice must be negative for any sufficiently small z_ave. I don't know whether the slices are intended to start at the box edge, or the box edge is the middle of the first slice, so I can't suggest a fix.

For that frame:

Breakpoint 2, calc_order (fn=0x65cec0 "nvt3mix.trr", index=0x65cf70, a=0x6ce7b0, order=0x7fffffffddc8, s1Order =0x7fffffffddc0, s1Width=0x7fffffffddbc, nslices=200, bSliced=1, bUnsat=0, top=0x65af60, ePBC=0, ngrps=7, axis =2, permolecule=0, radial=0, distcalc=0, radfn=0x0, distvals=0x7fffffffdb20, oenv=0x65ce80) at /home/marklocal/git/r51/src/gromacs/gmxana/gmx_order.c:650
650 slCount[slice]++; /* determine slice, increase count */

(gdb) print slice
$1 = -1
(gdb) print t
$2 = 19062
(gdb) print axis
$3 = 2
(gdb) print box[axis][axis]
$4 = 20
(gdb) print z_ave
$5 = 0.0176316798
(gdb) print z1
$6 = 0.132036507
(gdb) print z2
$7 = -0.0967731476
(gdb) print *slWidth
$8 = 0.100000001
